Problem  - Millions of eligible citizens don't know which government welfare schemes they qualify for. - Scheme information is scattered across government websites in complex bureaucratic language. - Application processes are confusing, causing eligible people to abandon or never attempt applying.	Solution  - Conversational AI agent (via Telegram/WhatsApp) that asks simple questions to build a user profile. - AI-powered matching engine that cross-references the profile against scheme eligibility criteria instantly. - Plain-language summary of matched schemes + step-by-step application guidance.	Unique Value Prop.  Find every government scheme you qualify for — in a 2-minute chat, in your own words.	Unfair Advantage  - Conversational-first design (no app/portal to learn) — hard to replicate without rebuilding UX from scratch. - Aggregated, structured, up-to-date scheme eligibility database — the compilation itself is the moat. - Early integration with local distribution channels (CSCs/NGOs) creates a trust relationship competitors can't easily copy.	Customer Segments  - Low-to-middle income individuals/families — farmers, daily wage workers, small business owners. - Students seeking scholarships. - First-generation smartphone users comfortable with WhatsApp/Telegram but not web portals.
Existing Alternatives  - Word-of-mouth - Visiting a Common Service Centre (CSC) in person - Relying on local agents/intermediaries who sometimes charge informal fees	Key Metrics  - Number of conversations completed. - Number of successful scheme matches delivered. - Conversation completion rate (% who finish profiling vs. drop off). - Application follow-through rate (if trackable). - Average time-to-match (should be minutes, not days).	High-Level Concept  YojnaDost = PolicyBazaar for welfare benefits	Channels  - Telegram/WhatsApp (zero-install, familiar interface). - Partnerships with Common Service Centres (CSCs) and NGOs for offline-to-online referral. - Word-of-mouth / community health worker and panchayat-level distribution.	Early Adopters  Digitally-active youth who help older family members navigate government processes.
Cost Structure  - LLM API costs (Groq API calls — usage-based). - n8n hosting/automation infrastructure. - WhatsApp Business API costs (if scaled beyond Telegram). - Development and maintenance (team time). - Scheme database upkeep (keeping eligibility criteria current).			Revenue Streams  - Government/NGO partnership grants for citizen outreach. - CSR funding from corporates under mandated social spending. - Optional B2G licensing — white-labeling the agent for state governments.
